Implementation report on OSPAR Recommendation 18/01 on radioactive discharges by the Netherlands

OSPAR: nuclear installations

2016-2019

OSPAR Convention

The Convention for the Protection of the Marine Environment of the North-East Atlantic (the "OSPAR Convention") was opened for signature at the Ministerial Meeting of the former Oslo and Paris Commissions in Paris on 22 September 1992. The Convention entered into force on 25 March 1998. The Contracting Parties are Belgium, Denmark, the European Union, Finland, France, Germany, Iceland, Ireland, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United Kingdom.

Convention OSPAR

La Convention pour la protection du milieu marin de l'Atlantique du Nord-Est, dite Convention OSPAR, a été ouverte à la signature à la réunion ministérielle des anciennes Commissions d'Oslo et de Paris, à Paris le 22 septembre 1992. La Convention est entrée en vigueur le 25 mars 1998.
Les Parties contractantes sont l'Allemagne, la Belgique, le Danemark, l'Espagne, la Finlande, la France, l'Irlande, l'Islande, le Luxembourg, la Norvège, les Pays-Bas, le Portugal, le Royaume-Uni de Grande Bretagne et d'Irlande du Nord, la Suède, la Suisse et l'Union européenne.

Acknowledgement

This report has been prepared by Cristina P. Tanzi and Pieter J. Kwakman of the National Institute for Public Health and the Environment (RIVM), on request by Patrick Arends of the Dutch Authority for nuclear safety and radiation protection, ANVS.

Contents

Executive Summary

OSPAR Recommendation 2018/01 on Radioactive Discharges aims to prevent and eliminate pollution caused by radioactive discharges from all nuclear industries and their associated radioactive waste treatment facilities and decommissioning activities, by applying the best available techniques (BAT) and the best environmental practice (BEP). This report illustrates the implementation of this Recommendation in the Netherlands following the guidelines in OSPAR Agreement 2018-01. This Recommendation supersedes PARCOM Recommendation 91/04. Information on the national legislation, environmental monitoring programmes, and the installations is given in the Country Profile of the Netherlands which is available on the www.ospar.org website.
The information presented in this report indicates that BAT/BEP has been applied to all nuclear installations in the Netherlands: the only operational nuclear power plant in the Netherlands, the nuclear fuel enrichment plant, two research reactors, and the nuclear waste treatment and storage plant. For all nuclear installations a clear downward trend in the discharges is visible or the reported values are already at a very low level.

1. Abstract

This report presents the discharges of radioactive substances to sea by nuclear installations in the Netherlands between 2016 and 2019. The preceding period 1998-2015 is covered by previous reports [OSPAR18 and OSPAR13], so this report focuses on the changes and additional information since the year 2016 onwards. The techniques used to reduce these discharges and details on the nuclear installations are described in the previous report over the period 1998-2007 and in the Country Report. This report fulfills the recommendation of the OSPAR Convention to report regularly on these discharges and techniques.

The Netherlands has ratified the OSPAR Convention, which entered into force in 1998. The aim of the OSPAR Convention is to prevent and eliminate pollution and to protect the marine environment of the North-East Atlantic (including the North Sea) against the adverse effects of human activities. The agreement is to prevent pollution as much as possible and to terminate discharges where possible.

In the reporting period for al nuclear installations a clear downward trend is visible or the level of discharges to the North Sea is very low.
The highest radiation dose resulting from the discharges to sea has been assessed for each of the nuclear installations. Each dose is less than one thousandth of the average radiation dose for individuals in the Netherlands.

Key words:
OSPAR, radioactive substances, nuclear power plant, nuclear installation, discharges, water, marine environment, North Sea, the Netherlands

1. Introduction

The OSPAR Recommendation 18/01 concerns application of best available technique (BAT) and best environmental practice (BEP) in accordance with Appendices 1 and 2 of the Convention to prevent and eliminate pollution caused by radioactive discharges from all nuclear industries, including nuclear power plants, reprocessing facilities, fuel fabrication facilities, research reactors, and their associated radioactive waste treatment facilities and decommissioning activities. After 2019 Contracting Parties should report every six years on the implementation of this Recommendation in accordance with the guidelines.

The OSPAR Recommendation 18/01 supersedes the PARCOM Recommendation 91/4. The Netherlands has reported compliance with PARCOM Recommendation 91/4 during seven implementation rounds.

This report concerns the eight implementation round – the first according to the OSPAR Recommendation 18/01 – concerns the implementation of BAT and BEP at the nuclear installations in the Netherlands.

The Country Profile available on www.ospar.org provides information on the relevant national authorities and responsibilities, the national legislation and basis for regulation, the application of BAT/BEP in domestic legislation, the dose limit, constraints and discharge limit setting rationale, the regulation, surveillance and monitoring, the environmental monitoring programmes, the radiation dose assessment methods, the environmental norms and standards and the quality assurance.

This document reviews the situation in the Netherlands over the period 2016 − 2019, and is part of the 8th round of implementation reporting. Information over the years 2008 − 2015, which is covered by previous reports [OSPAR18, OSPAR13], is also added here, for convenience. Information pertaining to the years 1998 – 2007 is given elsewhere [OSPAR09, also available as RIVM09].

Annex A to this report provides additional information on the location of the nuclear installations and specific sampling locations of the national monitoring programme. Figures showing the discharges and emissions normalized to the granted limits and annual production figures can be found in Annex B. The environmental impact is illustrated in Annex C, and Annex D reports a selection of the environmental measurements in the vicinity of the nuclear power plant of Borssele. In Annex E the specific references for the discharge data since 2008 are given for each year and for each installation.

2. The Nuclear Power Plant in Borssele

The information on discharges to water over the years 2007-2019 has been reported annually to the OSPAR Secretariat, including the annual electric output of net produced electricity, and is available on www.ospar.org. The liquid discharges of total alfa, total gamma and rest beta are all very low and are summarized in Annex B. The liquid discharge of H-3 is given in Table 2.1.

In June 2011 the plant has been licensed to use other fuels in addition to enriched Uranium (to a maximum of 4.4% in weight of U-235), namely MOX (to a maximum of 5.41% in weight of fissile Pu, with a maximum allowed number of MOX fuel elements in the reactor of 48, which corresponds to 40% of the total), and compensated enriched reprocessed uranium (c-ERU, enriched to a maximum of 4.6% in weight of U-235 to compensate for U-236 content), and to burn a nuclear fuel element of HTP-type up to a maximum of 68 MWd/kgU (pin average).

Systems to reduce discharges are summarised in paragraph 3.2.1 of an earlier report [OSPAR09]. A schematic representation is given in Fig. 6.10 of [KCB15]. The efficiency of the distillation step, except for tritium, is about a factor 10^4 [KCB15].

***Table 2.1**: Liquid discharges of H-3 of Borssele NPP (in TBq/GWa)*

	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019
H-3	13	15	16	15	15	18	22	7	15	15	13	13	14

Comparison with similar reactors

UNSCEAR [UNSC16] reports for the year 2010 an average value of 18 TBq/GWa of H-3 in liquid discharges for PWRs in the world. The reported discharges of tritium in liquid effluents of the PWR reactor Borssele are at or below this value since 2007, with the exception of the year 2013 when the discharge was 22 TBq/GWa. The liquid discharge of H-3 in 2014 of 7 TBq/GWa, the lowest of the time series, is due to a revision period taking place in the last months of 2013 (the tritium concentration in the primary system is reduced before a revision period). This revision period also has a relatively big influence on the total electricity production of the Borssele NPP in 2013 and therefor the normalised discharge of H-3 is significantly higher in 2013.

Emissions to air relevant for the marine compartment

The emission to air of H-3 and C-14 is given in Table 2.2.

***Table 2.2**: Emissions to air of Borssele NPP (in TBq/GWa)*

	2007	2008	2009	2010	2011	2012	2013	2014	2015
H-3	5.7E-01	7.1E-01	5.8E-01	5.8E-01	6.6E-01	6.3E-01	8.6E-01	6.8E-01	6.9E-01
C-14	3.1E-01	2.7E-01	3.4E-01	3.8E-01	4.0E-01	3.7E-01	5.2E-01	2.4E-01	2.9E-01

	2016	2017	2018	2019
H-3	6.5E-01	7.9E-01	4.1E-01	4.9E-01
C-14	3.5E-01	4.3E-01	3.1E-01	3.0E-01

Emissions of I-129 to air are not measured.

Radiation doses to the public

The individual effective dose via the marine exposure pathway is given in Table 2.3.

***Table 2.3:** Effective dose per year caused by liquid discharges of the Borssele NPP (in Sv)*

	2007	2008	2009	2010	2011	2012	2013	2014	2015
E (Sv)	6.8E-06	6.7E-06	5.6E-06	6.3E-06	4.2E-06	4.2E-06	4.8E-06	1.5E-06	2.5E-06

	2016	2017	2018	2019
E (Sv)	2.4E-06	1.8E-06	2.3E-06	2.7E-06

Site specific target discharge data

The discharge limits for liquid discharges per year of the Borssele NPP (in TBq) are given in Table 2.4.

***Table 2.4:** The discharge limits for liquid discharges per year of the Borssele NPP (in TBq)*

	Discharge limit
Total gamma and rest beta emitters	0.2
Tritium	30
Total alpha emitters	0.0002

The tritium discharge in waste water shows little variation. The tritium emissions to air also show little variation. In Annex B figures are given which show the discharges normalized to these permitted limits and to the annual electric output. The liquid discharges of beta/gamma emitters vary in the period 1998-2019 between 0.007% and 0.29% of the discharge limit and show since 2007 a downward trend.

2.1 Summary evaluation

An indication that BAT/BEP has been applied is a downward trend in the liquid discharges and dose estimates. In the case of the NPP in Borssele the emissions to air and water, normalized to the production in GWa, have been reduced where technologically possible. A downward trend is apparent for discharges of total gamma and residual beta to water, and the emissions remain constant at a relatively low level. Based on the graphs in figures B1 and B2 in Appendix B, since the use of MOX-fuel in 2017, there appear to be no changes in discharges

The calculated dose due to liquid discharges is consistently below 7E-06 microSv/a over the years 2007 to 2019. It follows that, according to these indicators, BAT/BEP has been applied in NPP Borssele.

Also, in the Netherlands, compliance with the ALARA principle is considered sufficient evidence that the requirements of BAT/BEP in terms of the OSPAR Convention have been met. At present, the NPP in Borssele is judged to be compliant with the ALARA principle. Furthermore, the discharges are low compared to the licensed discharge limits in the license and largely fulfill the site internal discharge targets. The normalized tritium discharges are equal or less than the reference data for the same type of reactor in the UNSCEAR report [UNSC16].

The information presented above is in accordance with the OSPAR guidelines and includes indicators that BAT/BEP has been applied in the NPP in Borssele.

3. The Fuel Enrichment Plant in Almelo

The information on discharges over the years 2007-2019, together with other changes since the previous reports [OSPAR18, OSPAR13], which cover the period 2007-2015, is given here. The discharges over the years 2007-2011 have already been reported in the previous reports [OSPAR18, OSPAR13] and they are also added here, for convenience.

The licensed production capacity was increased from 4500 tSW/y in 2007 to 4950 tSW/y in 2010, to 6200 tSw/y since 15 December 2011 (tSW stands for tonnes of Separative Work).

In Table 3.1 the fuel enrichment production in given, and in Table 3.2 the liquid discharges of the Almelo facility.

Table 3.1: *The fuel enrichment production (in tSW/y)*

	2007	**2008**	**2009**	**2010**	**2011**	**2012**	**2013**	**2014**	**2015**
tSW/y	3554	3644	4078	4550	4659	5268	5425	5426	5027

	2016	**2017**	**2018**	**2019**
tSW/y	5217	5237	5145	5149

Table 3.2: *Liquid discharges of Almelo facility (in TBq/tSW)*

	2007	**2008**	**2009**	**2010**	**2011**	**2012**	**2013**	**2014**	**2015**
total alpha	1.7E-10	1.7E-10	1.5E-10	1.6E-10	1.5E-10	2.7E-10	1.3E-10	1.5E-10	2.0E-10
beta/gamma	6.4E-10	8.2E-10	7.7E-10	3.0E-10	3.8E-10	5.7E-10	7.6E-10	3.1E-10	3.2E-10

	2016	**2017**	**2018**	**2019**
total alpha	1.2E-10	1.3E-10	1.4E-10	9.7E-11
beta/gamma	3.1E-10	3.6E-10	3.3E-10	2.3E-10

The figures in Annex B show the discharges normalized to the limits and to production.

3.1 Summary evaluation

An indication that BAT/BEP has been applied is a downward trend in the liquid discharges. A reduction can be observed in the discharges of radionuclides since the year 2007. This is mainly due to do the closing of separation plant SP3 and the expansion of the modern separation plant SP5.
Moreover, in the Netherlands compliance with the ALARA principle is deemed sufficient to meet the requirements of BAT/BEP in terms of the OSPAR Convention. At present, the fuel enrichment plant in Almelo is considered to comply with the ALARA principle.
The discharges are low compared to the discharge limits in the license. Also, the estimated dose for the critical group due to liquid discharges is very low, less than 1 µSv/year.
The information presented above is in accordance with the OSPAR Recommendation 18/01 and includes indicators that BAT/BEP has been applied in the fuel enrichment plant in Almelo.

4. The Research Facility in Petten

The information on discharges over the years 2007-2019, together with other changes since the previous report [OSPAR18, OSPAR13], which cover the period 2007-2015, is given here. The discharges over the years 2007-2011 have already been reported in the previous reports [OSPAR18, OSPAR13] and they are also added here, for convenience.

The LFR ("Low Flux Reactor") is dismantled. Since 2011, the only operational reactor on the Petten site is the HFR ("High Flux Reactor") research reactor owned by the European Commission. The reactor type is a tank-in-pool type reactor. Since 2015 there has been a large increase in the production of medical isotopes by the HFR.

The liquid discharges of the HFR and, until 2010, LFR are presented as a total of the Petten site in Table 4.1. The Petten site includes research laboratories and auxiliary industry like Curium (Mallinckrodt), and the discharges cannot easily be separated. Therefore, the data presented here are an overestimation of the actual discharges of the HFR (and – until 2010 – of the LFR). Table 4.2 reports the tritium emissions to air and Table 4.3 the effective dose caused by the liquid discharges.

Table 4.1: *Liquid discharges of Petten site (in GBq: i.e. not normalized)*

4.1 Summary evaluation

According to the Guidelines, an indication that BAT/BEP has been applied is a downward trend in the liquid discharges [OSPAR04]. The annual liquid discharges of the Petten site do not show such a downward trend, but vary from year to year. The effective dose due to the liquid discharges shows the same variation. Also the estimated dose for the critical group due to liquid discharges is very low, much less than 1 µSv/y.
In the Netherlands, the requirements of BAT/BEP in terms of the OSPAR Convention are met when the ALARA principle is applied. At present the Petten site is considered to comply with the ALARA principle.
The information presented above is in accordance with the OSPAR Agreement 2004-03 [OSPAR04] and includes indicators that BAT/BEP has been applied in the Petten site.

5. The Research Facility in Delft

This section gives information on discharges over the years 2007-2019. Information since the previous reports [OSPAR18, OSPAR13], which covers the period 2007-2015, is also added here, for convenience, see Table 5.1. The Research Facility in Delft operates a 2,3 MWth open pool reactor which has been in refurbishment since 2019.

5.1 Summary Evaluation

An indication that BAT/BEP has been applied is a downward trend in the liquid discharges. The annual liquid discharges of the research facility in Delft do not show such a downward trend but vary from year to year. However, the question whether or not BAT/BEP has been applied, is not only a matter of downward trends. In the Netherlands, the requirements of BAT/BEP in terms of the OSPAR Convention are met when the ALARA principle is applied. At present, the research facility in Delft is considered to comply with the ALARA principle. The discharges are low compared to the discharge limits in the license. Also the estimated dose for the critical group due to liquid discharges is very low, less than 0.009 Sv/y.
The information presented above is in accordance with the OSPAR Agreement 18/01 and includes indicators that BAT/BEP has been applied in the research facility in Delft.

6. Waste Treatment Plant COVRA in Vlissingen

The information on discharges over the years 2007-2019, together with other changes since the previous report [OSPAR18], which covers the period 2007-2015, is given in Table 6.2 and Table 6.3. The discharges over the years 2007-2015 have already been given in the previous report [OSPAR18] and they are also added here, for convenience.

The efficiency of the waste water treatment system is given in the Table 6.1. For each nuclide in this table the activity concentration after the treatment is divided by the activity concentration before. A "slip-through" factor of 0.3 therefore means a wastewater cleaning efficiency of 70%.
A report of 2006 [VL06] shows that BAT/BEP are applied to the wastewater treatment systems.

6.1 Summary Evaluation

In the Netherlands, the requirements of BAT/BEP in terms of the OSPAR Convention are met when the ALARA principle is applied. At present, COVRA is considered to comply with the ALARA principle.
The discharges are low compared to the discharge limits in the license. Also the estimated dose for the critical group due to liquid discharges is very low, much less than 0.001 □Sv/y.
The information presented above is in accordance with the OSPAR Agreement 18/01 and includes indicators that BAT/BEP has been applied in the storage facility of COVRA.

Annex C: Environmental Impact in the Netherlands

Although discharges of Dutch and foreign nuclear installations lead to an increase of the activity concentrations in the environment, it cannot be expected that the environmental monitoring data are associated to a unique discharge source. For this reason the environmental impact is presented in this appendix and not in the main text.

Concentrations of radionuclides in samples

Activity concentrations are frequently measured in environmental samples from several locations in waters of the Netherlands. In this report data from nine specific locations, for which an increase of the activity concentration in the environment may be expected, are presented. A map of these nine locations is given in Annex A. The median value for the measured activity concentrations in a year is given. The data up to 2015 are extracted from http://www.waterbase.nl and for 2016 and onwards from https://waterinfo.rws.nl.

NI: No Information

Nuclide libraries

The reported activity concentrations are total alpha, total and residual beta, H-3, Pb-210/Po-210, Sr-90 and Ra-226. Residual beta is the total beta activity excluding K-40, H-3 and short-lived radon daughters.
The nuclide library Nuchart, a product of Canberra, is used to identify gamma emitting radionuclides in environmental samples. However, only Co-58, Co-60, Cs-134, Cs-137, I-131 and Mn-54, are reported, if the radionuclides are detected. The library is based on NUDAT (produced by the National Nuclear Data Center, Brookhaven National Laboratory).

Environmental monitoring program

The environmental monitoring programme consists of measuring water samples and suspended particles. The frequency of sampling is variable per year per nuclide and per location. For each of the alpha, residual beta and tritium activity measurements an average sampling frequency of 12 times per year per location is kept. Ra-226, Sr-90, Sr-89, Po-210 and gamma (Cs-137, etc.) activity is measured with a sampling frequency between 4 and 13 times per year per location. Rijkswaterstaat monitors the activity concentrations at 10 locations in inland waters and at 11 locations at sea.

National target levels of radioactive substances

National target levels of activity of radionuclides in the environment are defined for inland waters. Compliance is assessed by comparing the 90th percentile of the measured data, which is not given in this report, with the target levels.

Table C5*: National target levels (in Bq.m^{-3}) [TPW98].*

Total alpha	1.0E+02
Residual beta	2.0E+02
Tritium	1.0E+04

Quality assurance of systems for environmental monitoring

The methodology of environmental monitoring is according to NEN 5622[1], NEN 5623[2], and NEN 6421[3] for the determination of alpha, gamma and beta activities respectively. NEN is a Dutch quality assurance standard. Beta and alpha emitters are monitored according to KTA 1504[4].

Annex D: Environmental Measurements in the Vicinity of NPP Borssele and the Waste Treatment Plant COVRA in Vlissingen

Since the year 2007, the results of the monitoring programme around NPP Borssele are made available through the reports on environmental radioactivity that are compiled by the Netherlands within the framework of the EURATOM Treaty. This is a collation of data from those reports:

Environmental radioactivity in the Netherlands.

Resultaten dosistempo- en radioactiviteitsmetingen in de omgeving van Borssele over het jaar 2019, Vertrouwelijk, In opdracht van N.V., EPZ jaar 2019, nr: 24515/20.166704, 21 februari 2020

The Nuclear Research & consultancy Group (NRG) is commissioned by Elektriciteits-Productiemaatschappij Zuid-Nederland (N.V. EPZ) to perform monthly measurements on environmental samples taken in the vicinity of the nuclear power plant at Borssele (owned by N.V. EPZ). NPP Borssele and the waste treatment plant COVRA make use of the same wastewater outlet into the Westerscheldt. Samples are taken to monitor the compartments air (not shown here), water and soil. The monitoring program presented here [Donk, 2008, Delorme, 2009 and Donk, 2011] forms only part of the total monitoring program performed near the nuclear power plant. A more detailed description of the monitoring program and underlying strategy is reported in KEMA, 1994. This monitoring program is evaluated by NRG in 2019 [NRG, 2019]. The monitoring programme over the years 2007 to 2019 is shown in Table D.1, with the locations given in Figure D.1. The measurements of radionuclides in water (Tables D.2 and D.3, Figures D.2 and D.3), suspended solids (Table D.4 and Figure D.4), seaweed and sediment (Tables D.5 and D.6) are reported here.

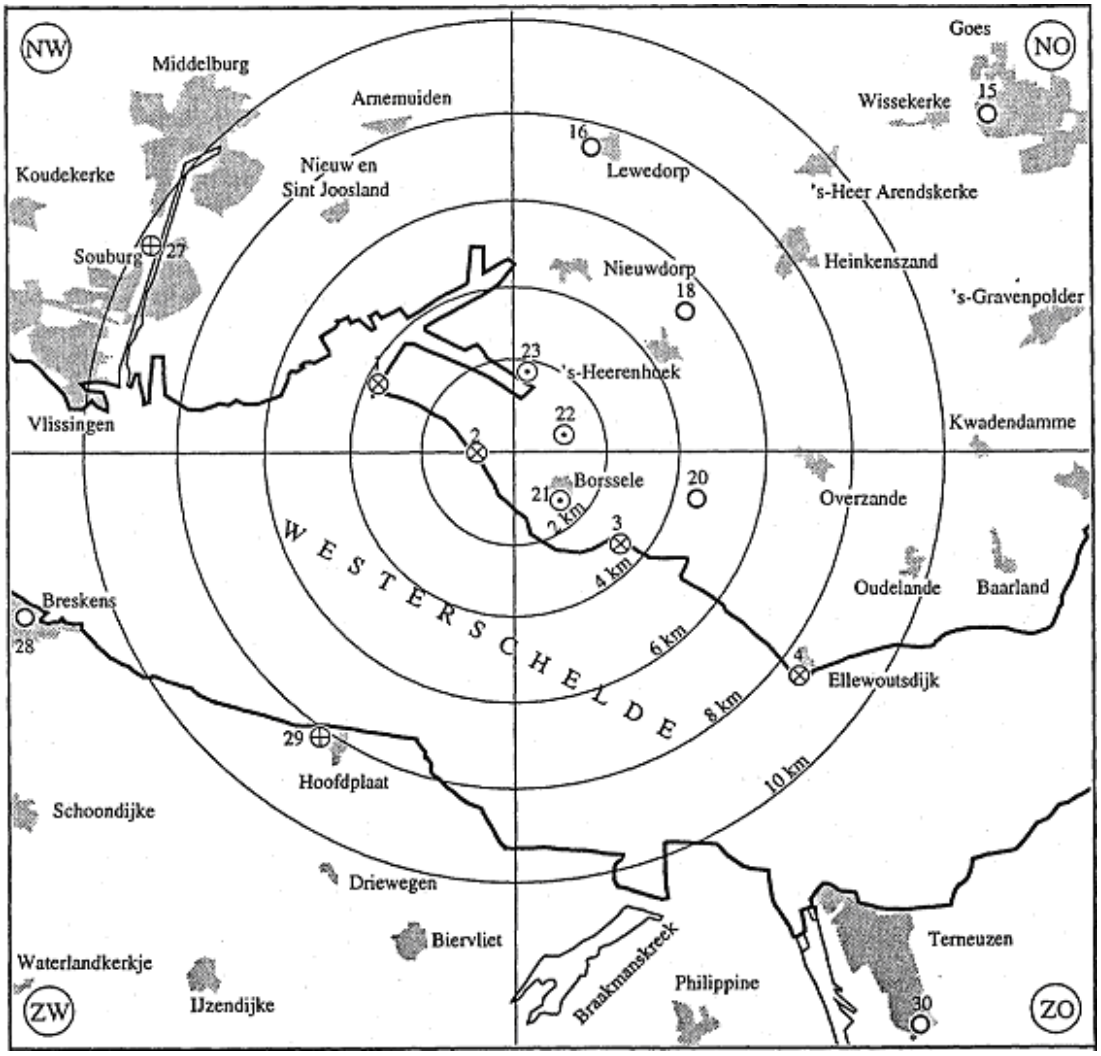
Table D.1: Monitoring program for environmental samples in the vicinity of the nuclear power plant at Borssele. The location numbers correspond with the location numbers given in Figure D.1.

Matrix	Location	Parameter	Monitoring frequency (per year)
Water	1, 2, 3 and 4	residual β, ^{3}H	12
Suspended solids	1, 2, 3 and 4	gross β	12
Seaweed	1, 2, 3 and 4	γ-emitters (1)	12 (2)
Sediment	1, 2, 3 and 4	γ-emitters (1)	12 (2)

(1) *γ-spectroscopic analysis of specific γ-emitting nuclides: ^{60}Co, ^{131}I and ^{137}Cs.*

(2) *Analysis is performed on a combined sample of monthly samples of all four or five locations.*

Figure D.1: *Monitoring program for environmental samples in the vicinity of the nuclear power plant at Borssele (centre of the map) and the waste treatment plant COVRA in Vlissingen located at approximately 1 km in North-West direction.*



The residual β and H-3 activity concentrations in water and gross β-activity concentrations in suspended solids from the Westerscheldt are presented in Tables D.2, D.3 and D.4. The respective yearly averages are shown in Figure D.2, D.3 and D.4.

Since 2012, the ^{3}H activity concentrations in water are significantly lower than those in previous years. Since 2012, the gross β activity concentrations in suspended solids have been somewhat higher than those in previous years. These changes in ^{3}H and gross β activity concentrations were investigated. The determination of gross β in 2019 for location 3 has been specifically re-examined, with inconclusive results. The change in gross β activity coincides with a change in counting efficiency. For ^{3}H no significant changes in analysis procedures have been identified.
The results for the nuclides considered in the gammaspectroscopic analysis (Co-60, I-131 and Cs-137) in seaweed and sediment are given in Tables D.5 and D.6.

Figure D.2: *Yearly averaged residual β-activity concentrations from Table D.2 in water from the Westerscheldt at four locations in the vicinity of NPP Borssele (see Figure D.1 for locations). Figure from RIVM Report 2019-0216, with the addition of 2019 data.*

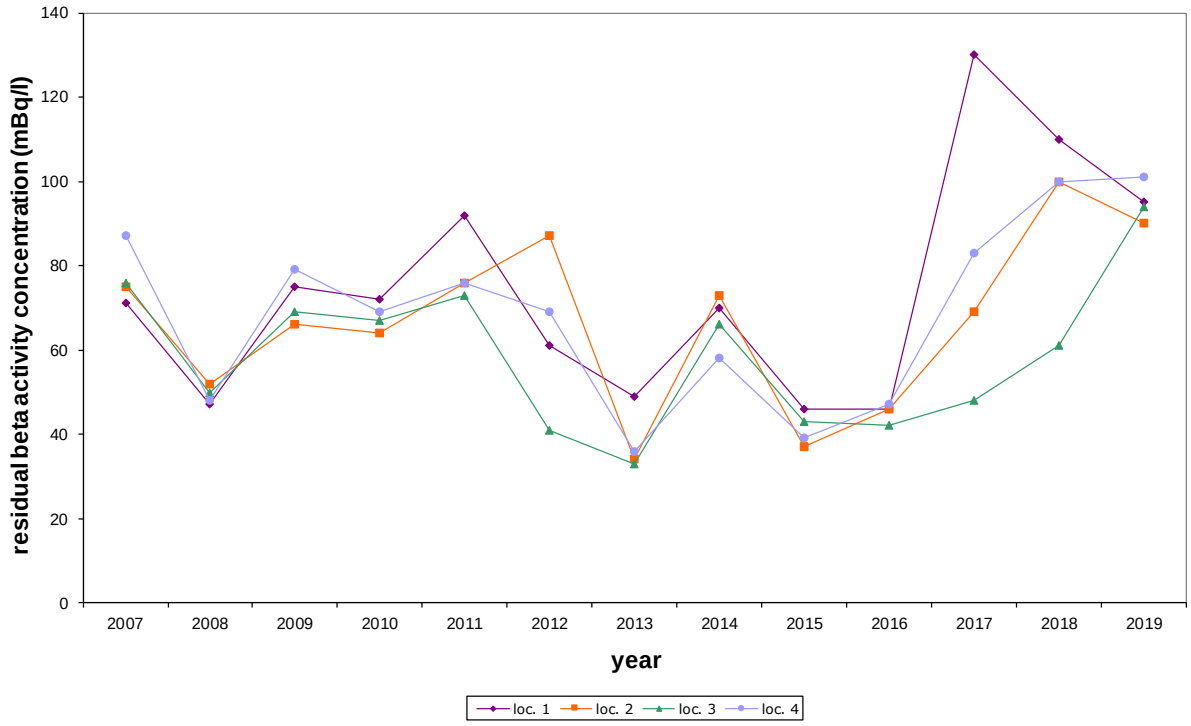


Figure D3: *Yearly averaged H-3 activity concentrations from Table D.3 in water from the Westerscheldt at four locations in the vicinity of NPP Borssele (see Figure D.1 for sampling locations). Figure from RIVM Report 2019-0216, with the addition of 2019 data*

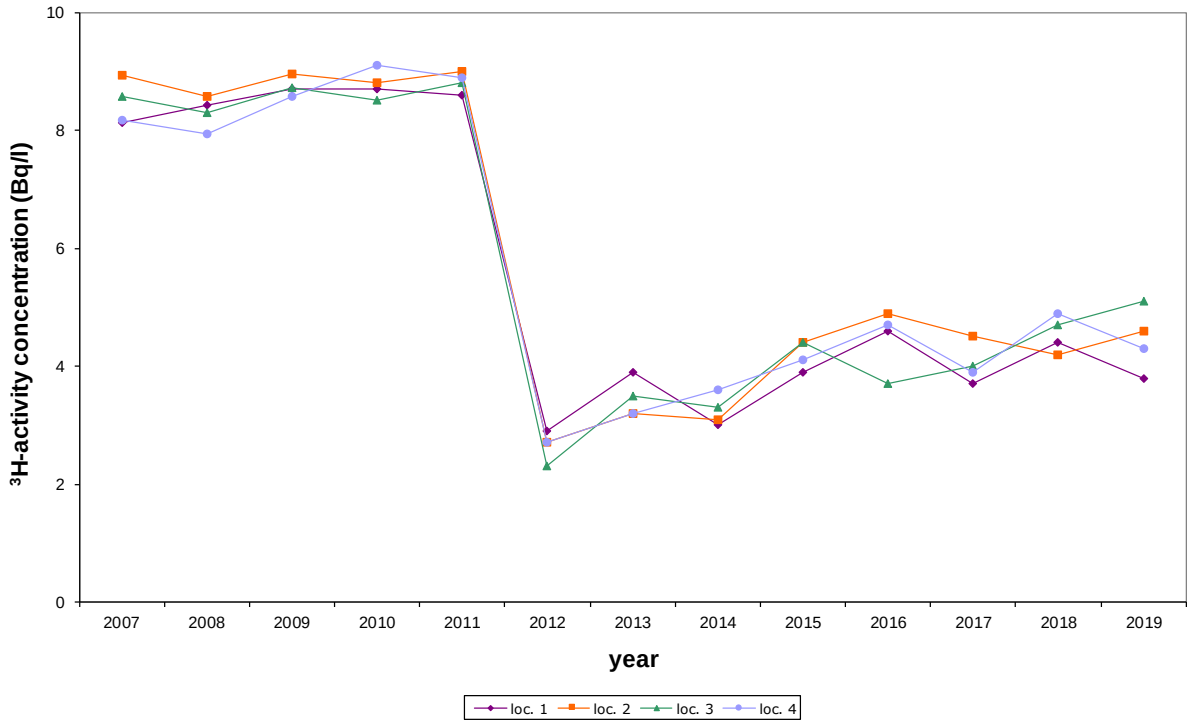

Figure D.4: *Yearly averaged gross β-activity activity concentrations from Table D.4 in suspended solids from the Westerscheldt at four locations in the vicinity of NPP Borssele (see Figure D.1 for sampling locations). Figure from RIVM Report 2019-0216, with the addition of 2019 data.*

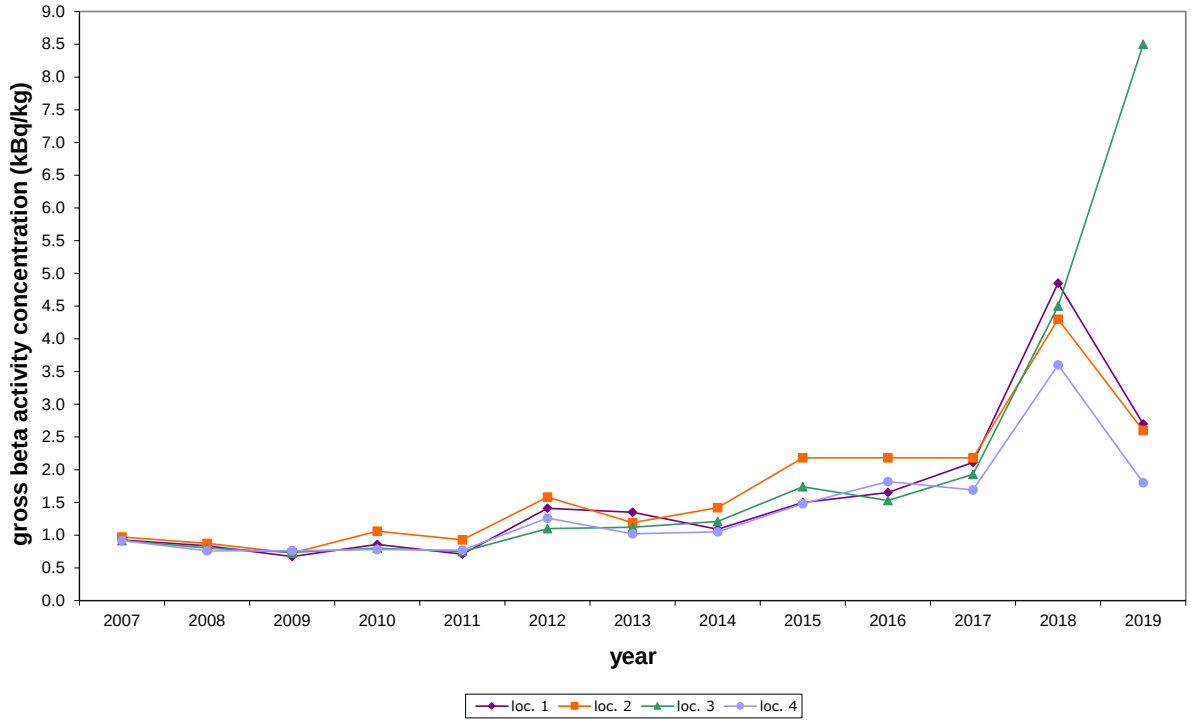

Table D.2 *Residual β-activity concentrations in water from the Westerscheldt (see Figure D.1 for sampling locations).*
